

PAIFLOW · INVESTOR DRAFT

Paiflow

Zaps for Payments. **Powered by Stellar.**

Drag. Drop. Deploy. — programmable payments on Stellar Soroban, with **no Rust** and **no devs.**

v0.1 DRAFT · 2026

Programmable payments are **locked behind engineers.**

- Every fintech, SMB, payroll team, or DAO that wants conditional, scheduled, or split payments today must **hire Rust developers** — or be stuck with off-the-shelf SaaS that doesn't fit.
- Stellar's **Soroban** unlocks programmable money, but the UX is "go learn a smart-contract toolchain."
- **There is no middle layer** between "send-a-payment button" and "build-your-own contract."

→ Result: 99% of operators who'd benefit can't ship.

Paiflow is that middle layer.

A visual builder for payment automations.

- Drag a **trigger** (`On Receive` , `On Schedule` , API, email).
- Drop an **action** (`Pay` , `Split` , `Stream`).
- Add **logic** (oracle, threshold, multisig).
- Click **Deploy** → a pre-audited Soroban contract is live in ~90 seconds.

Non-custodial by design. Paiflow never holds keys — users sign in their own wallet.

AI-assisted authoring. Describe the flow in plain English; Paiflow drafts the canvas.

Three audited templates cover ~80% of real-world use cases out of the gate.

90 seconds from idea to on-chain.

01 · DRAG

Pick `On Receive USDC` from the palette.
Drop it on the canvas.

02 · DROP

Add `Split 60 / 30 / 10` to three wallets
— Alice, Bob, Charlie.

03 · DEPLOY

Sign in Freightier. QR code appears. Scan,
send **10 USDC**, watch three payouts fan
out live.

→ Same loop powers payroll, treasury, escrow, marketplaces, DAO
ops.

Real-world payment workflows, **visually**.

- **Auto-schedule salaries** — pay 50 contractors every 1st & 15th, in USDC.
- **API-triggered payouts** — Shopify webhook → split revenue with co-founders.
- **Email-triggered payments** — invoice paid → release affiliate commission.
- **Oracle-conditional escrow** — release funds if $\text{BTC} > \$X$ or game outcome resolves.
- **Streaming compensation** — pay grants per-second over 12 months.
- **Notify on payout** — email/SMS recipients when their tranche lands.
- **Prediction-market settlement** — auto-distribute pool to winning side.
- **Tiered treasury rules** — 70% ops, 20% reserve, 10% community, every inflow.

Every block composes. Every flow becomes one Soroban contract on Stellar.

Stellar is the payment rail. Soroban makes it programmable. We make it usable.

Stellar: ~5s settlement, sub-cent fees, native USDC, regulated on-ramps, and **real adoption with payment companies** (MoneyGram, Circle, IBM World Wire alumni).

Soroban: mainnet-live Rust smart-contract platform purpose-built for payments and assets.

The shift now:

- **No-code** is how SaaS scaled from devs to operators (Zapier, Retool, Webflow).
- **AI** collapses the last mile — describe the flow, get the contract.
- **Stablecoins** are eating cross-border payments.

Paiflow sits at the intersection.

Target: **operators**, not protocol engineers.

Initial wedge

- **Crypto-native SMBs & DAOs** — payroll, treasury, contributor payouts.
- **Web3 fintechs** building on Stellar — embed Paiflow flows as their payments layer.
- **Remittance & payout operators** — programmable splits at the edge.

Why they buy

- Today: Rust contractor at \$150/hr, 2-week build, ongoing audits.
- With Paiflow: **launch in an afternoon**, audited templates, no custody risk.

TAM signal: Zapier crossed \$200M ARR by being a verb. "Paiflow it" is the same shape for money.

Self-serve SaaS, billed per active flow.

Tier	Price	What you get
Free	\$0	1 active flow · testnet · community support
Starter	\$29 / mo	5 flows · mainnet · email notifications · 10k events/mo
Pro	\$149 / mo	25 flows · API + webhook triggers · SMS · 100k events · SLAs
Business	\$499 / mo	Unlimited flows · SSO · audit log export · 1M events · priority
Enterprise	Custom	Dedicated infra · custom templates · contract audits · co-sell

Revenue add-ons: per-event metering above tier, white-label embed, and template marketplace rev share.

From hackathon demo to **programmable payment fabric**.

NOW · Q2 '26

Three audited templates (Splitter, Streamer, Conditional). Testnet live. Visual builder shipping. Hackathon demo.

NEXT · Q3 '26

Mainnet GA · API & webhook triggers · email/SMS · AI flow authoring · 10 design-partner pilots.

LATER · '27

Template marketplace · oracle integrations (Reflector, Pyth) · multi-chain export · embedded SDK.

Built non-custodial from day one – no money-transmitter risk; users sign every action.

Team

Founders [placeholder]

- [Name] — CEO · ex-[Co], built [thing]
- [Name] — CTO · ex-[Co], Stellar/Soroban contributor
- [Name] — Design · ex-[Co], shipped [product]

Advisors [placeholder]

- [Name] — Stellar Development Foundation
- [Name] — Payments / fintech operator

The ask

Raising \$[X]M seed to:

- Ship mainnet GA + AI flow authoring
- Onboard the first **50 paying SMBs / DAOs**
- Hire 2 engineers, 1 design partner success lead
- Fund external audits of every shipped template

→ **Let's make programmable payments boring.**
